15. Develop a Wireframe for a Mobile Application that Addresses Challenges Related to Ad Hoc Wireless Networks Using Figma

Aim: To develop a mobile application wireframe using Figma that addresses challenges in ad hoc wireless networks, such as network connectivity, node discovery, routing, and communication between devices without fixed infrastructure.

Procedure:

1. Open Figma and create a new design file.
2. Create a mobile frame with a suitable smartphone screen size.
3. Design a home screen displaying network status, connected devices, and available network options.
4. Create a device discovery screen to identify nearby wireless devices or nodes.
5. Design a network connection screen that allows users to connect or disconnect from nearby nodes.
6. Add a routing information screen to display the communication path between different devices.
7. Include a network monitoring screen to show signal strength, connection status, and data transmission details.
8. Add options for handling network failures, changing routes, and reconnecting disconnected devices.
9. Use Figma's Prototype feature to connect all screens, test the navigation, and export the completed wireframe.

Output:

Result:

Thus, a mobile application wireframe addressing the major challenges of ad hoc wireless networks was successfully designed using Figma.
